Manage tracing

You can configure how SMI-S Provider manages trace files, such as specifying the components to be traced, the target to which trace messages are written, the level of tracing, and the trace file location.

Specifying trace settings

Having tracing enabled is important for gathering information for troubleshooting. However, having tracing enabled can impact performance, so carefully consider what must be traced and how long you need tracing enabled.

Before you begin

- · You must already have login credentials as Administrator.
- You must already have logged in to the host system as Administrator.

Steps

- 1. Access NetApp SMI-S Provider.
- 2. Specify various trace settings as applicable:

Action	Command
Specify the components to be traced	<pre>cimconfig -s traceComponents=components -p</pre>
Specify the trace facility	cimconfig -s traceFacility=facility -p
Specify the location of the trace file	<pre>cimconfig -s traceFilePath=path_name -p</pre>
Specify the trace level	cimconfig -s traceLevel=level -p

3. Restart the CIM server:

smis cimserver restart

Trace setting values

You can specify the components to trace, the trace target, and the level of tracing. Optionally, you can change the name and location of the trace file if you do not want to use the default trace file name and location.

You can configure the following trace settings:

traceComponents

Specifies the components to be traced. By default, all components are traced.

traceFacility

Specifies the target to which trace messages are written:

• File

This is the default value, which specifies that trace messages are written to the file specified by the traceFilePath configuration option.

Log

Specifies that trace messages are written to the cimserver standard log file.

traceFilePath

Specifies the location of the trace file. By default, the trace is file is named cimserver.trc and is located in the traces directory.

traceLevel

Specifies the level of tracing. By default, tracing is disabled.

Trace level	Trace messages written
0	Tracing is disabled.
1	Severe and log messages.
2	Basic flow trace messages (low data detail)
3	Inter-function logic flow (medium data detail)
4	High data detail
5	High data detail + Method enter and exit

Specify trace file size

If tracing is enabled, the maximum trace file size is 100 MB by default. You can increase or decrease the maximum trace file size by setting the environment variable PEGASUS_TRACE_FILE_SIZE. The value of the trace file size can be 10 MB through 2 GB.

Before you begin

- · You must already have login credentials as Administrator.
- You must already have logged in to the host system as Administrator.

Steps

- 1. Access NetApp SMI-S Provider.
- 2. Create a system or user environment variable named PEGASUS_TRACE_FILE_SIZE with the new trace file size in bytes.

Windows documentation has more information about creating environment variables.

3. Restart the CIM server:

smis cimserver restart

Specify the number of trace files saved

If tracing is enabled, seven trace files are saved by default. If you need more trace files saved, you can increase the maximum number of trace files saved by setting the environment variable PEGASUS_TRACE_FILE_NUM. If you increase the maximum number of trace files saved, you must ensure that the system has enough space on its hard drive to accommodate the trace files.

Before you begin

- You must already have login credentials as Administrator.
- · You must already have logged in to the host system as Administrator.

About this task

If tracing is enabled, tracing information is written to the cimserver.trc file. The trace files are rotated. When cimserver.trc reaches the maximum trace file size, its contents are moved to the cimserver.trc.n file. By default, n is a value from 0 through 5. If you need more trace files saved, you increase the value of n.

Steps

- 1. Access NetApp SMI-S Provider.
- 2. Create a system or user environment variable named PEGASUS_TRACE_FILE_NUM with the new number of trace files saved.

Windows documentation has more information about creating environment variables.

3. Restart the CIM server:

smis cimserver restart
